

NanoTransfer Set™ Generation II Quick Start Guide

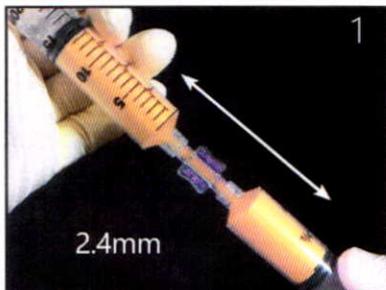

The single-use NanoTransfer is a proprietary (patent-pending) single-use device designed to uniformly size harvested adipose tissue so that it is easily injected with 30g needles. This sized tissue is often referred to as Nanofat. For more information on the NanoTransfer system and/or uses of Nanofat, please call or email a Tulip representative.

Acquire Adipose Graft

- Infiltrate harvest site (subdermal fat) with tumescent solution using a 2.1mm Tulip GEMS Infiltrator on a 20cc syringe.
- Harvest subdermal fat (15-20cc) using a 20cc syringe attached to a 2.1mm Tulip GEMS harvesting cannula, equipped with a 20cc GEMS Johnnie Snap.
- Gravity decant harvested specimen for 3 minutes in syringe.
- Expel infranatant fluid from beneath the graft.
- Use sterile 2.4mm GEMS Anaerobic Transfer to transfer the graft to a sterile 20cc syringe leaving the supernatant free lipid (clear yellow oil) in the harvesting syringe. Discard harvesting syringe. **Do not** discard 2.4mm GEMS transfer.

Emulsify (2.4mm)

- Attach the sterile syringe holding the graft to another sterile 20cc syringe using the 2.4mm Tulip GEMS Anaerobic Transfer.
- Manually force the graft back and forth between syringes **30 times** to initiate emulsification. (See Fig. 1)
 - You now have microfat that can pass through a 19g cannula

Size Down

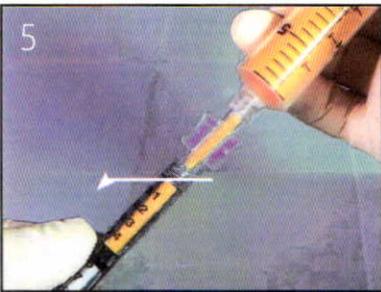

- Replace the 2.4mm transfer with a GEMS 1.4mm Sizing Transfer.
- Manually force the graft back and forth between syringes **30 times** (15 times each direction) to further size down the graft consistency.
 - You now have microfat that can pass through a 21g cannula or needle
- Repeat this step using the GEMS 1.2mm Sizing Transfer.
 - You now have microfat that can pass through a 23g cannula or needle (See Fig. 2)
- Adipose graft is now ready to pass through the NanoTransfer.

NanoTransfer Set Generation II instructions continued from page 1

Final Pass Through the NanoTransfer Generation II

- NOTE: The input port is the top of the NanoTransfer. The output port is on the side of the cylinder. Both are labeled. **Before applying pressure to the NanoTransfer, stand it on a flat surface for use. DO NOT hold it in the air while applying pressure.**
- To obtain the Nanofat, attach the syringe containing the graft to the input port of the NanoTransfer, (See Fig. 3) and firmly transfer the graft into the receiving syringe of the same size. (See Fig. 4)
- Using a GEMS anaerobic transfer, pass the Nanofat from the collection syringe into the desired injection syringes (1cc recommended). (See Figs. 5-6)

Please refer to the Tulip Medical Products IFUs (instructions for use).

Device preparation and operation should take place using a sterile field protocol.
